Introduction

Applications can make our work quicker and easier, e.g. there are a few that allow us to select any region on our desktop screen and edit it before taking screenshot so we do not have to use any other application – everything related to this task is in one. But there are a lot of tasks that we do often and these tasks have their own dedicated applications so why not to make **one** application that can do all of these repetitive tasks? For this idea the Quick Manager is the solution.

Quick Manager Project

The Quick Manger project is to create an application that can make working with desktop computers even easier than it is today. The application has a lot of different build in tools that can help with various basic tasks such as transforming text or editing image files. The Quick Manager is very extensible so if the community spots that there could be more tools included they can create and add these tools by themselves. The Quick Manager has a lot of tools and with community tools such application can be hard to use so the UI must be very advanced in terms of controlling and using it.
